# ANVIS – 9

## Aviation Flight Night Vision Goggles

---

This double-tube, Mil-spec 3<sup>rd</sup> Generation, 64/L/P night vision system is designed to be used as a helmet-mounted, bi-ocular assembly. It enables the aviator to view objects at night from as close as 10 inches to infinity with only a simple focus adjustment!

The ANVIS-9 system gives helicopter pilots the capability to judge rotor clearance while remaining masked and negotiating terrain obstacles. This system has been tested and successfully used on missions in hostile territory while flying Cobra and Apache helicopters as well as various other aircraft.

In this picture a modified ANVIS-9 system is shown mounted to an AN/PVS7D night vision headgear but still serves the same capability and purpose of the helmet mounted system.
